

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1. - 10. (Canceled).

11. (Currently Amended) The apparatus according to ~~claim 10~~ claim 16, wherein the receiving surface and emission surface are of substantially the same size.

12. (Currently Amended) The apparatus according to ~~claim 10~~ claim 16, wherein the impact detection element surrounds at least partially the protruding component to be protected.

13. (Currently Amended) The apparatus according to ~~claim 10~~ claim 16, wherein the light source comprises at least one light-guiding fiber, and the emission surface is defined by the end of the light-guiding fiber.

14. (Currently Amended) The apparatus according to ~~claim 10~~ claim 16, further comprising an intensity sensor, which is associated with the receiving surface.

15. (Currently Amended) The apparatus according to ~~claim 10~~ claim 16, wherein the receiving surface is a reflective surface that directs the light emitted from the emission surface onto at least one further light-guiding fiber, connected to an intensity sensor, whose end defines a further receiving surface.

16. (Previously Presented) An apparatus for protecting a protruding component comprising:

- a housing part to which the protruding component is connected;
- an impact detection element movably connected to the housing part via at least one elastically bendable rod;
- a light source coupled to the housing part defining an emission surface; and

a receiving element coupled to the impact detection element defining a receiving surface arranged opposite the emission surface of the light source.

17. (Previously Presented) The apparatus according to claim 14, wherein the intensity sensor generates an electrical signal corresponding to the power level of the light striking the receiving surface, which serves for open-loop or closed-loop control or monitoring of a movement operation.

18. – 21. (Canceled).

22. (Currently Amended) The apparatus according to ~~claim 10~~ claim 16, wherein a light path between the receiving surface and the emission surface is smaller than a cross section of the emission surface.

23. - 24. (Canceled).

25. (Currently Amended) The apparatus according to ~~claim 10~~ claim 16, wherein the apparatus is configured so that, during a non-collision, light emitted from the light source is received at the receiving surface and, during a collision, light emitted from the light source is not received at the receiving surface.

26. – 27. (Canceled).

28. (Currently Amended) The apparatus according to ~~claim 27~~ claim 33, wherein the receiving surface and emission surface are of substantially the same size.

29. (Currently Amended) The apparatus according to ~~claim 27~~ claim 33, wherein the impact detection element surrounds at least partially the protruding component to be protected.

30. (Currently Amended) The apparatus according to ~~claim 27~~ claim 33, wherein the light source comprises at least one light-guiding fiber, and the emission surface is defined by the end of the light-guiding fiber.

31. (Currently Amended) The apparatus according to ~~claim 27~~ claim 33, further comprising an intensity sensor, which is associated with the receiving surface.

32. (Currently Amended) The apparatus according to ~~claim 27~~ claim 33, wherein the receiving surface is a reflective surface that directs the light emitted from the emission surface onto at least one further light-guiding fiber, connected to an intensity sensor, whose end defines a further receiving surface.

33. (Previously Presented) An apparatus for protecting a protruding component comprising:

- a housing part to which the protruding component is connected;
- an impact detection element movably connected to the housing part via at least one elastically bendable rod;
- a light source coupled to the impact detection element defining an emission surface;
- and
- a receiving element coupled to the housing part defining a receiving surface arranged opposite the emission surface of the light source.

34. (Previously Presented) The apparatus according to claim 31, wherein the intensity sensor generates an electrical signal corresponding to the power level of the light striking the receiving surface, which serves for open-loop or closed-loop control or monitoring of a movement operation.

35. (Currently Amended) The apparatus according to ~~claim 27~~ claim 33, wherein a light path between the receiving surface and the emission surface is smaller than a cross section of the emission surface.

36. (Canceled).

37. (Currently Amended) The apparatus according to ~~claim 27~~ claim 33, wherein the apparatus is configured so that, during a non-collision, light emitted from the light source is received at the receiving surface and, during a collision, light emitted from the light source is not received at the receiving surface.

38. (Canceled).
